Dr. Marwan M. Krunz
ECE Building, Room 365
Email: krunz@email.arizona.edu. Phone: 621-8731
Office Hours: Wednesday 10–11am, Friday 3–4pm, and by appointment

Class Material

There is no textbook for this class. The material will be covered from:

- **Class notes** — Notes will be provided in several parts, which will be posted on the D2L class page (https://d2l.arizona.edu) or emailed to students. To access the D2L page, you need to log in using your UA NetID and password.

- **Assigned reading** — Technical articles from the literature will be assigned throughout the semester. Their titles will be announced in class and posted on the class web page, whose URL is given above (Note: This is NOT the same as the D2L page assigned to the class). Electronic copies of such articles can often be obtained from the UA Digital Library. Papers not available in the UA Digital Library will be provided on D2L. Reading material will be continuously assigned throughout the semester. You should check the class page periodically for the latest assigned reading. Unless indicated otherwise, you are responsible for the content of all assigned papers.

- **IETF RFCs and IEEE standards**.

**Prerequisites**

- Introductory graduate/undergraduate course to computer networking (e.g., ECE 578).

- Introductory graduate or upper-level undergraduate course in probability theory and random processes (e.g., ECE 503).

**Note:** Depending on your background, you may still be allowed to enroll in this class even if you have not taken ECE 578 and ECE 503. However, you must discuss your situation with the instructor and get his permission.

**Course Objectives**

The goal of this course is to expose students to recent advances in packets networks, with focus on the architectural and protocol aspects underlying the design and operation of these networks. The course covers protocols related to medium access, routing, quality-of-service provisioning, traffic/flow control, and media streaming in various networked systems, including IP-based Internet, wireless LANs, ad hoc networks, sensor networks, dynamic spectrum access (DSA) networks, etc. (see the attached list of topics). In the process of learning network architectures and protocols,
students will be exposed to various analytical methods that are used in the design and engineering of next-generation networks. They will also use simulations to evaluate the performance of various design concepts.

Remarks

1. Your homework assignments may require you to perform numerical computations or run discrete-event simulations. For assignments that require numerical computations, you can use C or Matlab. For simulation assignments, you are required to use the Csim software. Csim is a C-based programming environment for discrete-event simulation, developed by Mesquite Software. We will spend 1–2 lectures reviewing the basics of Csim, but that will not be enough to cover all of its features. Therefore, you should start reading the Csim documentation on your own as soon as possible, and before I cover it in class. Csim’s User’s Guide and various examples are available on the D2L page (see also http://www.mesquite.com/ under ‘Documentation’).

2. In lieu of a final exam, you will be required to study one topic in depth and present it to the rest of the class. The list of topics along with suggested papers will be provided by the instructor at a later time. On-campus students should work in pairs on their selected topics and presentations. Online students can work individually or in pairs. The schedule for class presentations will be posted at a later time. About 3-5 class lectures will be dedicated to student presentations. Online students will need to record and upload their presentations for viewing by the rest of the class outside the class time. For any given presentation, all students (including non-presenters) are required to read the assigned paper related to the presented topic before coming to class. Some presentations will be followed by short unannounced quizzes, so please be prepared.

3. Recorded Lectures: This course is being offered as part of the Online Master’s Degree in ECE. All classes will be recorded using the Panopto software, and will be available to both online and on-campus students for subsequent viewing. To view a recorded lecture, go to the D2L web site (https://d2l.arizona.edu) and log in using your UA NetID and password. You will see the D2L page for this class listed as “ECE 564 FA17 001 201” (“001” refers to the on-campus section, whereas “201” refers to the online section). Click on the link to enter the D2L class page. Click on ‘Content’ on the top menu, followed by ‘Lectures’ on the left menu. You will be able to play back recorded lectures. Note that although lectures are recorded in real-time, they can be viewed only after the recording has been completed (~ 2-3 hours after the class) and the view clip uploaded to the Panopto server.
General Course Policies

- Academic Integrity: The University’s Code of Academic Integrity (Section 2.1a) states that students shall not “represent the work of others as their own.” This policy will be applied to all work submitted for a grade: exams, quizzes, homework, and computer work. Any student submitting homework solutions or computer programs with part(s) copied from solutions provided by any instructor(s) in previous semesters, or from the text solutions manual, or from students who took the course in previous semesters, will automatically receive zero credit for ALL homework/computer work for the entire semester. In other words, all work must be original. The minimum penalty for cheating on exams and quizzes is an E grade. For the homework assignments other than the semester project, group efforts are not permitted and will be considered academic dishonesty.

You are free to use reference books to help you with assignments, but make sure that you cite any used reference.

- No late homework will be accepted.

- Make-up exams will be given only in emergency, which must be supported by written documentation (e.g., doctor’s letter).

- All work must be completed during the semester (i.e., no incompletes will be given).
